IMPROVED MIDRANGE DRIVER

We are introducing a modified K-55-V driver with a new phasing plug providing improved response between 4 and 6 kHz.

The "raw" response (no crossover network) of the old and new units is shown in the two curves.

The new driver is readily recognized by the solder lugs used in the place of the old style "push-terminals". This exterior change was made simultaneously with the phasing-plug modification to prevent confusion.

Home entertainment loudspeakers built on or after March 24, 1980 incorporate the new squawker driver. The change-over date for industrial products was April 3, 1980.

We think it will be obvious that the new curve is prettier (more nearly flat) but the audible improvement may not be as obvious.
